

Chapter 15 Solution Chemistry

Mixtures - A combination of two or more substances in which they retain their individual properties and can be physically separated. (ex: Salt + water)

Homogeneous - Uniform throughout. (ex: Milk)

Heterogeneous - Not Uniform throughout. (ex: Italian dressing)

★ Solutions - Smallest particles

- Parts of a Solution:

Solute - The substance that gets dissolved.

Solvent - The substance that does the dissolving.

Types of Solutes:

Ionic - (Metal + Non-Metal) $\text{NaCl}_{(s)} \xrightarrow{\text{H}_2\text{O}} \text{Na}_{(aq)} + \text{Cl}_{(aq)}$

Covalent (molecular) - (Non-metals only) $\text{C}_6\text{H}_{12}\text{O}_6_{(s)} \xrightarrow{\text{H}_2\text{O}} \text{C}_6\text{H}_{12}\text{O}_6_{(aq)}$ (Don't break apart)

* Dissociation - Ionic compounds break apart into ions when dissolving.

* Solubility - Amount of Solute that can dissolve in a given amount of solvent at a specific temperature.

Saturated Solution - Maximum amount of Solute is dissolved at a given temperature. (On the line)

Unsaturated Solution - Less than the maximum amount of Solute dissolved at a given temperature. (below the line)

Super Saturated Solution - More than the maximum amount of Solute dissolved at a given temperature.

Chapter 12 Solution Chemistry

Mixtures - A combination of two or more substances in which they retain their individual properties and can be physically separated. (ex: salt + water)
Homogeneous - Uniform throughout (ex: milk)
Heterogeneous - Not uniform throughout (ex: Italian dressing)
* Solutions - smallest particles
- parts of a solution:

Solute - The substance that gets dissolved.
Solvent - The substance that does the dissolving.
Types of solutes:

Ionic - (Metal, Non-Metal) Molecules
Covalent (molecular) - (Non-metals only) Molecules
* Dissociation - Ionic compounds break apart into ions when dissolving.

* Solubility - Amount of solute that can dissolve in a given amount of solvent at a specific temperature.

Saturated solution - Maximum amount of solute is dissolved at a given temperature. (On the line)
Unsaturated solution - Less than the maximum amount of solute dissolved at a given temperature. (below the line)

Supersaturated solution - More than the maximum amount of solute dissolved at a given temperature.

Factors that affect solubility

Temperature - Solids: For most solids as T goes up solubility goes up.

- Gases: As T goes up, solubility goes down.

Pressure - Gases only - As P increases S_g increases.

Polarity - "like dissolves like" Polar dissolves Polar, non-polar dissolves non-polar.

Molarity

Measuring concentration

Molarity - How many mols of solute = $\frac{m}{L}$

3.0 M HCl

↳ (1 L = 3 mol)

$$250 \text{ mL} \times \frac{1 \text{ L}}{1000 \text{ mL}} = 0.25 \text{ L}$$

$$0.25 \text{ L} \times 3.0 \text{ mol/L} = 0.75 \text{ mol}$$

$$3.0 \text{ mol HCl} \times 0.25 \text{ L} = 0.75 \text{ mol}$$

$$0.75 \text{ mol} \times \frac{36.5 \text{ g HCl}}{1 \text{ mol HCl}}$$

$$= 27.3 \text{ g HCl}$$

$$22.6 \text{ g} \times \frac{1 \text{ mol}}{110.8 \text{ g}} = 0.2 \text{ mol CaCl}_2$$

$$M = \frac{0.2 \text{ mol CaCl}_2}{0.35 \text{ L CaCl}_2} = 0.57 \text{ M CaCl}_2$$

Factors that affect solubility

Temperature - Solids: For most solids as T goes up solubility goes up.

Gases: As T goes up solubility goes down.

Pressure - Gases only - As P increases solubility increases

Polarity - "like dissolves like" Polar dissolves polar

non-polar dissolves non-polar

Molarity

Molar concentration

$$\text{Molarity} = \frac{\text{How many moles of solute}}{\text{L of solution}}$$

M

$$3.0 \text{ M HCl} \quad (10 \text{ mL} = 3 \text{ mol})$$

$$3.0 \text{ mol} \times \frac{1 \text{ L}}{10 \text{ mL}} = 0.3 \text{ L}$$

$$3.0 \text{ mol} \times 0.3 \text{ L} = 0.9 \text{ mol}$$

$$0.9 \text{ mol} \times \frac{1 \text{ L}}{0.3 \text{ L}} = 3.0 \text{ M HCl}$$

$$0.9 \text{ mol} \times \frac{1 \text{ L}}{0.3 \text{ L}} = 3.0 \text{ M CaCl}_2$$

$$M = \frac{0.9 \text{ mol CaCl}_2}{0.3 \text{ L}} = 3.0 \text{ M CaCl}_2$$
